## DISKETTE CONTENTS - LYNX DEVELOPMENT SYSTEM

### Handy A2000 Boot Disk:

1 Normal AmigaDos disk. A copy of the standard development system boot disk used at Epyx. This disk is only necessary if you have a system that doesn't boot off of the hard disk.

### DH0:

1 Quarterback V4.3 disk. A copy of the "boot partition" of the standard hard disk setup used in the development system. Does not contain the file devs/MountList, allowing the contents to be restored directly to a hard disk that has already been partitioned correctly.

### "Standard" system:

6 Quarterback V4.3 disks. A complete copy of the "standard" development system at Epyx, with the most recently used copies of the development tools.

These disks assume your Amiga is an Amiga 2000 with 3MB of RAM and a 40 MEG hard drive with Workbench V1.3. They also assume you have a copy of Quarterback V4.3 to unarchive your files. Your hard disk drive should be partitioned as a standard DH0 boot partition and a DH0B fast file partition. DH0 should be named Boot Part and DH0B should be named AmigaHD.

By the way, some of the test examples in 6502 examples may not work. They need to have includes for .var files put into them. For example, hmusic.var and hsfx.var are not included in testmusic.src. The .var files can be found in 6502.src.

Have Fun!!
